

## **Design Thinking: Solving life's problems**

Design thinking is other concept that I heard very often but I did not have the feedback of what is it. Suresh Jayakar gave us the definition of the term in his own words, and also gave us the example of how It could be helpfull.

I think design thinking is the solution for problems that would not be solve with the traditional methods. One of the mistakes that I see in my mates and in myself is that we always have the convergent mentality. With out projects, We always start thinking about the algorithms and the back complexity that It could had. We start thinking about how the process will be and when is the time to recollect the requirements We are always focus in the functional requirements; in other words we only look for solve the problem with our hard skills. The design thinking help us to watch the full panorama, no only the functionality and the performance, but also the relevance and how much It could help the society.

In the talk, the speaker talk us about the hackaton where his idea was born. The main idea of the hackaton could be the perfect opportunity to carry out the method and put it in action with a real problem.

Finally, I feel like the concept of design thinking could be based on the “who” is going to use the application, “who” is the person who you want to help, and “how” you could give him the best product with a method “out of the box” and a solution that might not exist.
